

## ABSTRACT

A lollipop with a plurality of stems extending radially from a central node with at least one candy affixed to the distal ends of the stem members. A candy may also be affixed to the central node. Additionally, multiple candies may be affixed to the ends of  
5 the stem members and the central node. The candies may vary in size, shape, color and flavor to provide the consumer with a plethora of confectionary options to indulge in with a single lollipop. A handling member is also affixed to the distal end of at least one non-candied stem member. The handling member, or members, affords the consumer with enhanced maneuverability so that the different candies may be rotated or spun for quick  
10 and comfortable engagement with the mouth.
